Revision of the theoretical and observational grounds of the seismic hazard estimates at a national scale

- ⇒ The committee studied carefully the structure of the project that we turned down two years ago. This project was funded by GNDT for one year only with a new scope.
- ⇒ The presentation of activities during the first year is not complete, and some lines of research were not developed because of reduction of funds, according to the general presentation by the coordinator.
- ⇒ The committee encourages the author to work on macroseismic intensity and drop the other peripheral objectives, which are already covered by other GNDT projects.
- ⇒ This project should perhaps integrate, complement and reinforce Amato's project.
